Irish radar detection research project takes off

The Centre for Telecommunications Value Chain Research (CCTR) today announced that a research project into ultra-wideband (UWB) radar detection technology being conducted by a team at the Dublin Institute of Technology (DIT) has been funded by Enterprise Ireland.

The research is being conducted in collaboration with IBM. The centre is part of the DIT’s ICT research group, has developed new antenna designs that measure the level of accuracy of Irish radar systems. In time, commercialisation of UWB will likely allow developers to create applications that can be used in precision farming or even radar technology.
